

User Persona: Afif – The Non-Twi-Speaking Professional

Overview

Afif is a young professional living and working in Ghana. Although he has spent a significant amount of time in the country, he is not fluent in Asante Twi and often struggles to understand conversations, recordings, and instructions delivered entirely in the language.

He represents a growing demographic of students, professionals, expatriates, and residents who regularly interact with Twi-speaking communities but lack sufficient proficiency to comfortably understand spoken Twi.

Background

- Age: 20–35
- Occupation: Professional / Student
- Location: Ghana
- Languages Spoken: English (Primary), Limited Twi
- Technical Proficiency: Moderate to High

Afif works and socializes in environments where Twi is frequently used. While he can identify certain common words and phrases, understanding complete conversations or lengthy recordings remains challenging.

Goals

- Understand important information contained in Twi audio recordings.
 - Reduce reliance on friends, colleagues, or translators.
 - Access information quickly and independently.
 - Improve communication with Twi-speaking individuals.
 - Save time spent replaying recordings.
-

Frustrations

- Receiving audio recordings he cannot fully understand.
- Having to replay recordings multiple times.
- Missing important details due to language barriers.
- Depending on others for translation and clarification.
- Difficulty searching or referencing information contained in audio recordings.

Typical Scenario

Afif receives a recorded meeting summary from a colleague. The recording is entirely in Twi and contains important updates related to a project.

Because he is not fluent in Twi, he listens to the recording multiple times but still struggles to understand certain sections. To avoid misunderstandings, he asks another colleague to summarize the recording for him.

The process consumes time, introduces delays, and creates dependency on others.

Needs

- A simple way to convert spoken Twi recordings into understandable English text.
 - Fast processing of audio recordings.
 - Accurate handling of conversational Twi and code-switching.
 - A user-friendly interface requiring minimal technical knowledge.
-

How the Twi Audio Transcriber Helps

The Twi Audio Transcriber allows Afif to upload a Twi audio recording and receive readable English text that captures the meaning of the recording.

Instead of replaying audio multiple times or relying on others for assistance, he can quickly review, search, copy, and reference the information whenever needed.

The result is improved accessibility, productivity, and communication across language barriers.
